

### VACUUM PACKED METAL POWDERS

Ronald Britton has the capability of supplying metal powders vacuum packed in foil laminate bags. Packing this way helps to preserve the shelf-life of the product by providing a barrier to air and moisture. It also offers protection against contamination.

Vacuum packing is particularly useful if the powder is to be used in small quantities at a time. Typically, if a 25kg drum of powder is opened several times before consumption, the exposure to air/humidity at each lid opening can adversely affect powder shelf-life. This can be detrimental to applications where excessive powder oxidation reduces performance or product appearance.

Vacuum packing is available in 1kg, 2.5kg and 5kg lots subject to a small additional charge.
